

# Energy efficient building element - Lessons learned from SESBE project

Eva-Lotta Kurkinen  
RISE Research institute of Sweden  
(SP Technical research institute of Sweden)

# An energy efficient building element

## What is it?

Low energy to produce

Low heat or cold losses during service

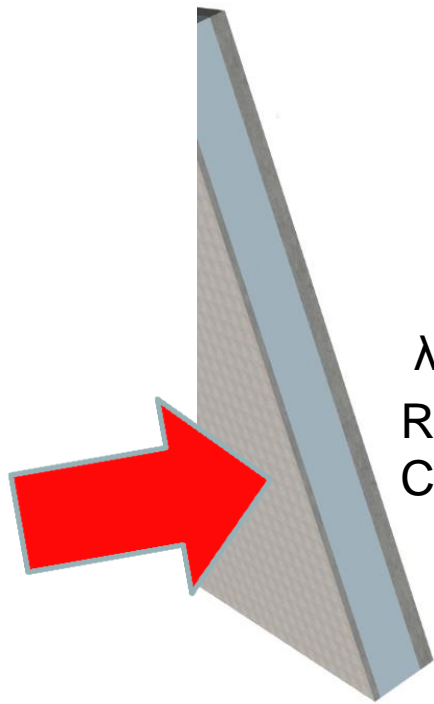

Long service life  
with little need  
of refurbish

# Low heat transfer through the building element

Thermal resistance,  $R$  ( $\text{m}^2\text{K}/\text{W}$ ):

25 mm

150 mm

25 mm

$\lambda=0.86 \text{ W}/(\text{m}\cdot\text{K})$   
Reactive powder  
Concrete (RPC)

$\lambda=0.030 \text{ W}/(\text{m}\cdot\text{K})$   
Foamed aerogel concrete

$$0.04+0.029+5.0+0.029+0.13$$
$$=5.23 \text{ m}^2\text{K}/\text{W}$$

**U-value:  $0.19 \text{ W}/\text{m}^2\text{K}$**

without any influence of thermal bridges

# Influence from thermal bridges

1. Window sill

2. Horizontal joint

3. Vertical Joint

# Influence from thermal bridges

4. Exterior Corner

5. Interior wall

6. Glass Fiber Connectors (double)

7. Point amplification

# Thermal bridges

	Internal	Overall Internal	External	
	$\Psi_i$	$\Psi_{oi}$	$\Psi_e$	
<b>Window Sill</b>	<b>0.033</b>	<b>0.033</b>	<b>0.033</b>	
<b>Horizontal Joint</b>	<b>0.069</b>	<b>0.022</b>	<b>0.022</b>	
<b>Vertical Joint</b>	0.026	0.026	0.026	
<b>Exterior Corner</b>	0.078	0.078	0.001	
<b>Interior Wall</b>	0.048	0.000	0.000	
<b>Glass Fibre Connector (double)</b>	0.0005	0.0005	0.0005	
	$\chi_i$	$\chi_{oi}$	$\chi_e$	
<b>Point Amplification</b>	0.0057	0.0057	0.0057	

# In the case of a concept building

10 m and 6.5 m

# Result for the concept building

1.  $0.284 \text{ W/m}^2\text{K}$  ( $1191\text{m}^2$  Internal Area) (+49%)
2.  $0.249 \text{ W/m}^2\text{K}$  ( $1358\text{m}^2$  Overall Internal Area) (+30%)
3.  $0.245 \text{ W/m}^2\text{K}$  ( $1382\text{m}^2$  External Area) (+28%)

Without thermal bridges  $U=0.191 \text{ W/m}^2\text{K}$

# What could we change in order to get a lower U-value?

- **Building element size**
- **Window area**
- **Window format**

A parametric study show that it possibly to lower the U-value with roughly 0,03 W/m<sup>2</sup>K by chosen few large windows instead of many small

# Result of changing window size

0.284 W/m<sup>2</sup>K (1191m<sup>2</sup> Internal Area) (+49%)

**0.253 W/m<sup>2</sup>K (1191m<sup>2</sup> Internal Area) (+32%)**

0.249 W/m<sup>2</sup>K (1358m<sup>2</sup> Overall Internal Area) (+30%)

**0.226 W/m<sup>2</sup>K (1358m<sup>2</sup> Overall Internal Area) (+18%)**

0.245 W/m<sup>2</sup>K (1382m<sup>2</sup> External Area) (+28%)

**0.223 W/m<sup>2</sup>K (1382m<sup>2</sup> External Area) (+17%)**

# Lessons learned

- Big influence from thermal bridges
- Different way to present the size of the thermal bridges (internal area, overall internal area and external area)
- Amount of windows and its size have big influence

# Lessons learned

- Effect of moisture

If the surface aren't protected from driven rain the U-value could change from  $0,191 \text{ W/m}^2\text{K}$  for a single panel to  $0,38 \text{ W/m}^2\text{K} = 99 \%$

(in Swedish and Norwegian climate)

# Another way to see it
